ABSTRACT

INTRODUCTION

METHODS AND MATERIALS

RESULTS

INTRODUCTION

Nineteen cases of carcinoma involving the buccal mucosa. Lesions originating from adjacent mucosal surfaces with extension into the buccal mucosa were included. There were 18 squamous cell carcinomas of the buccal mucosa of the buccal mucosa that involved single subsites and structures. A total of 13 (81%) patients received neo-adjuvant external beam radiation (tumor bed or neck). All patients with positive margins received adjuvant chemotherapy (60%). A number of recurrences and positive margins were found in Table III. Seventy-three patients were identified that received first-time surgical therapy for SCCA of the buccal mucosa and had adequate follow-up. Of these 73 patients, 21 (44%) had recurrences. Of these 21 recurrences, 13 (62%) were limited to adjacent subsites and 8 (38%) were distant recurrences. A retrospective review.

METHODS AND MATERIALS

RESULTS

DISCUSSION

The initial search of the two pathology databases (from 1972-2009) yielded 199 cases of carcinoma involving the buccal mucosa. Lesions originating from adjacent mucosal surfaces with extension into the buccal mucosa were included. There were 18 squamous cell carcinomas of the buccal mucosa of the buccal mucosa that involved single subsites and structures. A total of 13 (81%) patients received neo-adjuvant external beam radiation (tumor bed or neck). All patients with positive margins received adjuvant chemotherapy (60%).
